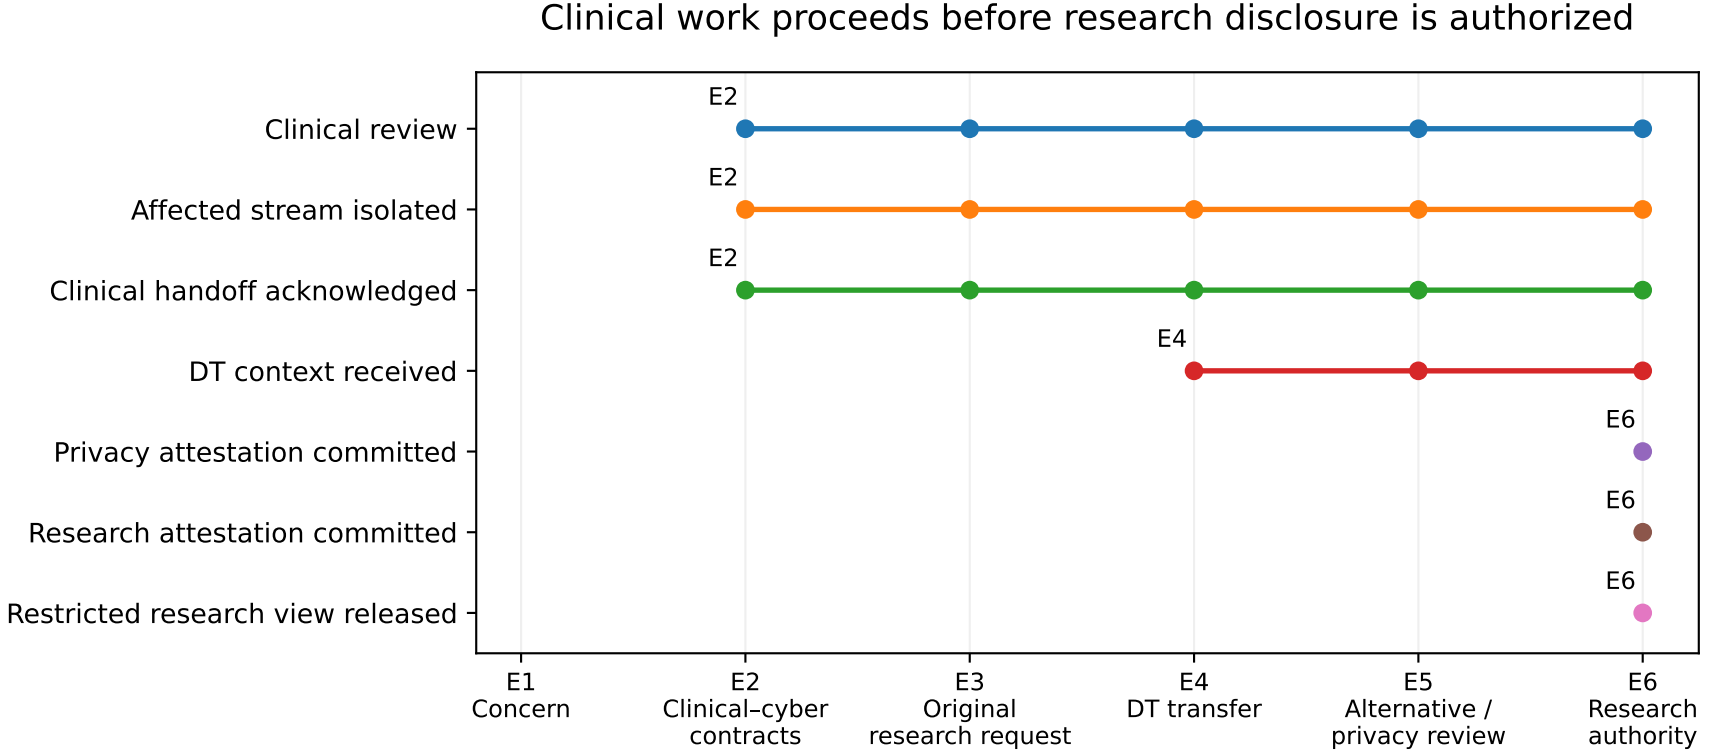
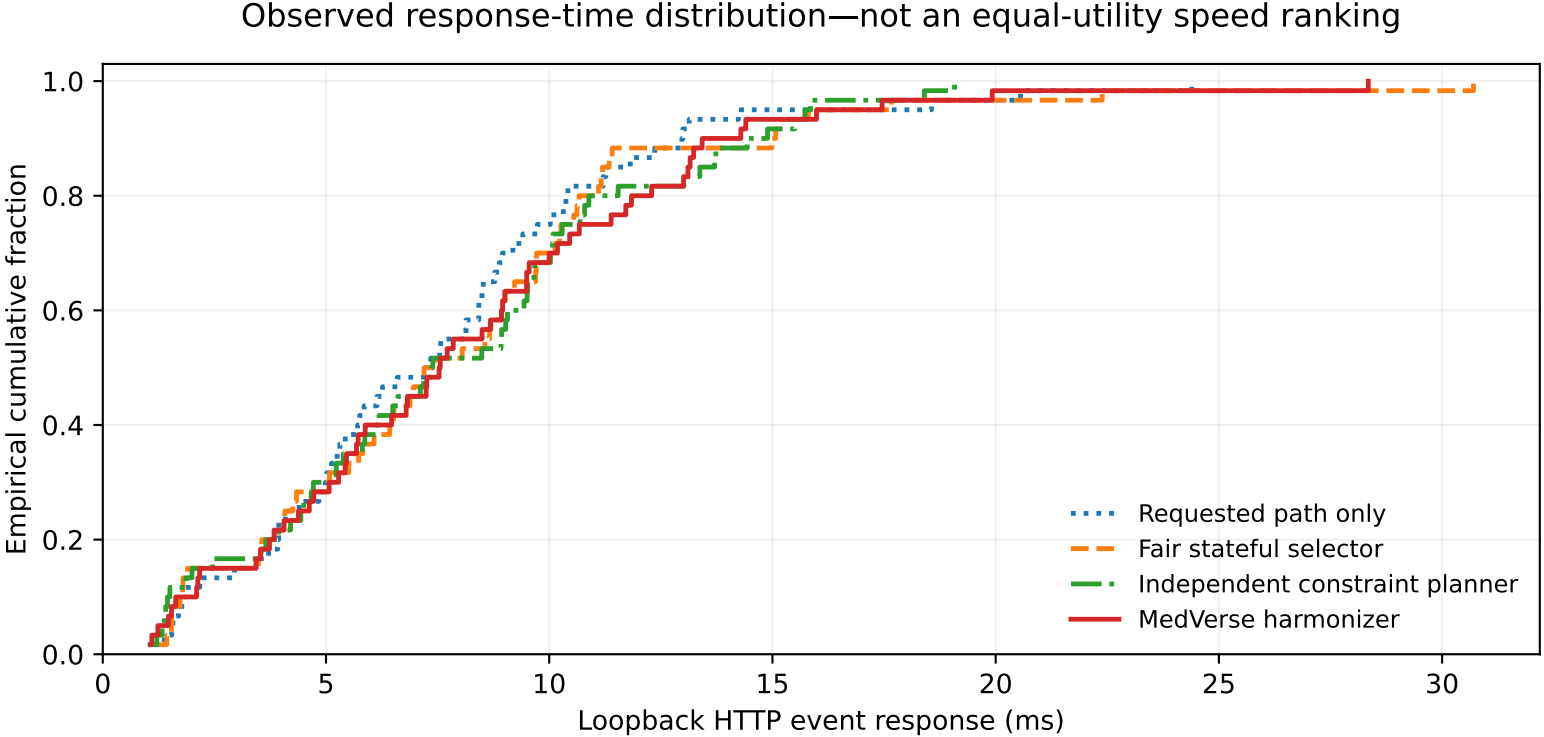
Snapshot correctness survives integration; late alternatives remain a challenge
Within each pair: snapshot (left) → progressive final state (right)
D02 Containment / acknowledgement
D03 Denied request / restricted view
C01 Session isolation / late care route
C02 Containment choice / late route
C03 No authorized clinical route
C04 Pending handoff authority
C05 Joint disclosure restriction
C06 Revoked original authority
C07 Task-adequate alternative
C08 Missing research evidence
C09 Stale DT / fresh alternative
C10 Policy binding / oversight
C11 Recipient mismatch
C12 Cross-institution flagship
Requested path only
Fair stateful selector
Independent planner
MedVerse harmonizer
Complete workflow
Partial / held: no complete snapshot solution
Available full workflow not completed
Later alternative blocked by earlier commitment
14 known families; 10 have a complete snapshot solution. Capable methods tie.
C01/C02 expose irreversible online choices; retained failures, not retuned cases.



C12 actual HTTP trace: clinical review commits at event 2; the restricted research view at event 6.
Dots represent achieved modeled effects, not diagnoses or real clinical actions.



60 event calls per configuration; 10 C12 replays, warmup excluded, randomized configuration order.
Includes JSON and loopback HTTP; excludes external network, model inference and human response.
